ARTS Data Modeling Concepts Logical Data Model Concepts Physical Data Model

- · What were the sales, returns, discount and net revenue by merchandise level (i.e. department, class, etc.) over a given time period for the store?
- What is the current inventory on-hand value and unit count by merchandise level at a given point in time?
- What are the sales of related items purchased together compared to those purchased individually?
- · What is the sales to stock ratio for a given period?

In order to be useful to store and corporate office management, sales and stock performance reporting views have to ascribe sales, return, receipts (both in financial terms and operational terms) and other activities to a ReportingPeriod. Also, they have to summarize item-level information into meaningful groupings of merchandise items to help managers identify sales and stock behavior patterns.
